

Section 2.1

Question 2

(a)

Let $S(t)$ represent the number of steps recorded t minutes after 3:00 PM. The slope of a secant line over an interval $[a,b]$ is

$$\frac{\Delta S}{\Delta t} = \frac{S(b) - S(a)}{b - a}$$

This slope represents the average walking rate in steps per minute.

(i) Interval $[0,40]$

$$\frac{S(40) - S(0)}{40 - 0} = \frac{7398 - 3438}{40} = \frac{3960}{40} = \boxed{99 \text{ steps/min}}$$

(ii) Interval $[10,20]$

$$\frac{S(20) - S(10)}{20 - 10} = \frac{5622 - 4559}{10} = \frac{1063}{10} = \boxed{106.3 \text{ steps/min}}$$

(iii) Interval $[20,30]$

$$\frac{S(30) - S(20)}{30 - 20} = \frac{6536 - 5622}{10} = \frac{914}{10} = \boxed{91.4 \text{ steps/min}}$$

b

The number of steps is given as a function of time t , measured in minutes after 3:00 PM.

Since 3:20 PM is **20 minutes after 3:00 PM**, we estimate the student's walking pace at $t = 20$ by averaging the slopes of two secant lines on either side of $t = 20$.

Secant slopes from part (a)

- On the interval $[10, 20]$:

$$\frac{5622 - 4559}{20 - 10} = \frac{1063}{10} = 106.3 \text{ steps/min}$$

- On the interval $[20, 30]$:

$$\frac{6536 - 5622}{30 - 20} = \frac{914}{10} = 91.4 \text{ steps/min}$$

Average of the two secant slopes

$$\frac{106.3 + 91.4}{2} = 98.85 \text{ steps/min}$$

Question 5

Given the height function (in feet):

$$y(t) = 275 - 16t^2$$

(a)

Average velocity over the interval $([4, 4 + \Delta t])$ is

$$v_{\text{avg}} = \frac{y(4 + \Delta t) - y(4)}{\Delta t}$$

First compute:

$$y(4) = 275 - 16(4)^2 = 19$$

i. $(\Delta t = 0.1)$

$$y(4.1) = 275 - 16(4.1)^2 = 6.04$$

$$v_{\text{avg}} = \frac{6.04 - 19}{0.1} = \boxed{-129.6 \text{ ft/s}}$$

ii. $(\Delta t = 0.05)$

$$y(4.05) = 275 - 16(4.05)^2 = 12.56$$

$$v_{\text{avg}} = \frac{12.56 - 19}{0.05} = \boxed{-128.8 \text{ ft/s}}$$

iii. $(\Delta t = 0.01)$

$$y(4.01) = 275 - 16(4.01)^2 = 17.7184$$

$$v_{\text{avg}} = \frac{17.7184 - 19}{0.01} = \boxed{-128.16 \text{ ft/s}}$$

(b)

As $(\Delta t \rightarrow 0)$, the average velocities approach

$$\boxed{-128 \text{ ft/s}}$$

(The negative sign indicates downward motion.)

Question 7

(a.) Average velocity on an interval $[a, b]$ is

$$v_{\text{avg}} = \frac{s(b) - s(a)}{b - a}.$$

From the table (position in feet, time in seconds):

$$s(2) = 20.6 \text{ ft}, \quad s(3) = 46.5 \text{ ft}, \quad s(4) = 79.2 \text{ ft}, \quad s(5) = 124.8 \text{ ft}, \\ s(6) = 176.7 \text{ ft}.$$

(i.) Interval $[2, 4]$:

$$\begin{aligned} v_{\text{avg}}[2, 4] &= \frac{s(4) - s(2)}{4 - 2} \\ &= \frac{79.2 \text{ ft} - 20.6 \text{ ft}}{4 \text{ s} - 2 \text{ s}} \\ &= \frac{58.6 \text{ ft}}{2 \text{ s}} \\ &= 29.3 \text{ ft/s}. \end{aligned}$$

$$\boxed{v_{\text{avg}}[2, 4] = 29.3 \text{ ft/s}}$$

(ii.) Interval $[3, 4]$:

$$\begin{aligned} v_{\text{avg}}[3, 4] &= \frac{s(4) - s(3)}{4 - 3} \\ &= \frac{79.2 \text{ ft} - 46.5 \text{ ft}}{4 \text{ s} - 3 \text{ s}} \\ &= \frac{32.7 \text{ ft}}{1 \text{ s}} \\ &= 32.7 \text{ ft/s}. \end{aligned}$$

$$\boxed{v_{\text{avg}}[3, 4] = 32.7 \text{ ft/s}}$$

(iii.) Interval $[4, 5]$:

$$\begin{aligned} v_{\text{avg}}[4, 5] &= \frac{s(5) - s(4)}{5 - 4} \\ &= \frac{124.8 \text{ ft} - 79.2 \text{ ft}}{5 \text{ s} - 4 \text{ s}} \\ &= \frac{45.6 \text{ ft}}{1 \text{ s}} \\ &= 45.6 \text{ ft/s}. \end{aligned}$$

$$v_{\text{avg}}[4, 5] = 45.6 \text{ ft/s}$$

(iv.) Interval $[4, 6]$:

$$\begin{aligned} v_{\text{avg}}[4, 6] &= \frac{s(6) - s(4)}{6 - 4} \\ &= \frac{176.7 \text{ ft} - 79.2 \text{ ft}}{6 \text{ s} - 4 \text{ s}} \\ &= \frac{97.5 \text{ ft}}{2 \text{ s}} \\ &= 48.75 \text{ ft/s.} \end{aligned}$$

$$v_{\text{avg}}[4, 6] = 48.75 \text{ ft/s}$$

(b.) Use the graph of s as a function of t to estimate the instantaneous velocity when $t = 3$.

Use average velocities on intervals closest to $t = 3$:

$$\begin{aligned} v_{\text{avg}}[2, 3] &= \frac{s(3) - s(2)}{3 - 2} \\ &= \frac{46.5 \text{ ft} - 20.6 \text{ ft}}{3 \text{ s} - 2 \text{ s}} \\ &= \frac{25.9 \text{ ft}}{1 \text{ s}} \\ &= 25.9 \text{ ft/s,} \end{aligned}$$

$$\begin{aligned} v_{\text{avg}}[3, 4] &= \frac{s(4) - s(3)}{4 - 3} \\ &= \frac{79.2 \text{ ft} - 46.5 \text{ ft}}{4 \text{ s} - 3 \text{ s}} \\ &= \frac{32.7 \text{ ft}}{1 \text{ s}} \\ &= 32.7 \text{ ft/s.} \end{aligned}$$

A reasonable estimate for the instantaneous velocity at $t = 3$ is the midpoint of these nearby slopes:

$$v(3) \approx \frac{25.9 + 32.7}{2} \text{ ft/s} = 29.3 \text{ ft/s.}$$

$$v(3) \approx 29.3 \text{ ft/s}$$

(b.) Use the graph of s as a function of t to estimate the instantaneous velocity when $t = 3$.

To estimate the instantaneous velocity at $t = 3$, we consider the slope of the tangent line to the graph of $s(t)$ at $t = 3$. Using the graph of the data points

$$t = [0, 1, 2, 3, 4, 5, 6], \quad s = [0, 4.9, 20.6, 46.5, 79.2, 124.8, 176.7],$$

a tangent line drawn at the point $(3, 46.5)$ has slope approximately 29.7.

Thus, the instantaneous velocity at $t = 3$ is estimated to be

$$v(3) \approx 29.7 \text{ ft/s}.$$

Section 2.2

Question 6

(a.) Left-hand limit

$$\lim_{x \rightarrow -3^-} h(x) = 4$$

Exists: Yes.

(b.) Right-hand limit

$$\lim_{x \rightarrow -3^+} h(x) = 4$$

Exists: Yes.

(c.) Two-sided limit

$$\lim_{x \rightarrow -3} h(x) = 4$$

Exists: Yes.

(d.) Function value

$$h(-3) \text{ DNE}$$

Exists: No.

Reason: There is no filled point at $x = -3$.

(e.) Left-hand limit

$$\lim_{x \rightarrow 0^-} h(x) = 1$$

Exists: Yes.

(f.) Right-hand limit

$$\lim_{x \rightarrow 0^+} h(x) = -1$$

Exists: Yes.

(g.) Two-sided limit

$$\lim_{x \rightarrow 0} h(x) \text{ DNE}$$

Exists: No.

Reason: The left-hand limit and right-hand limit are not equal.

(h.) Function value

$$h(0) = 1$$

Exists: Yes.

(i.) Two-sided limit

$$\lim_{x \rightarrow 2} h(x) = 2$$

Exists: Yes.

(j.) Function value

$$h(2) \text{ DNE}$$

Exists: No.

Reason: There is an open circle at $x = 2$ and no filled point.

(k.) Right-hand limit

$$\lim_{x \rightarrow 5^+} h(x) = 3$$

Exists: Yes.

(l.) Left-hand limit

$$\lim_{x \rightarrow 5^-} h(x) \text{ DNE}$$

Exists: No.

Reason: As x approaches 5 from the left, $h(x)$ oscillates between approximately 2 and 4 and does not approach a single value.

Question 10

A patient receives a 150-mg injection of a drug every 4 hours. The graph shows the amount $f(t)$ of the drug in the bloodstream after t hours.

Left-hand limit

$$\lim_{t \rightarrow 12^-} f(t)$$

Right-hand limit

$$\lim_{t \rightarrow 12^+} f(t)$$

Interpretation

- $\lim_{t \rightarrow 12^-} f(t)$ is the amount of drug just before the injection at $t = 12$.
- $\lim_{t \rightarrow 12^+} f(t)$ is the amount of drug immediately after the injection at $t = 12$.

Question 11

$$f(x) = \begin{cases} e^x, & x \leq 0, \\ x - 1, & 0 < x < 1, \\ \ln(x), & x \geq 1 \end{cases}$$

Given the piecewise function we determine the values of a for which $\lim_{x \rightarrow a} f(x)$ exists.

Each expression defining f is continuous on its interval. Therefore, $\lim_{x \rightarrow a} f(x)$ exists for all a in the interior of each interval. The limit can fail to exist only at the transition points $x = 0$ and $x = 1$.

At $x = 0$:

$$\lim_{x \rightarrow 0^-} f(x) = e^0 = 1, \quad \lim_{x \rightarrow 0^+} f(x) = 0 - 1 = -1$$

Since the one-sided limits are not equal, $\lim_{x \rightarrow 0} f(x)$ does not exist.

At $x = 1$:

$$\lim_{x \rightarrow 1^-} f(x) = 1 - 1 = 0, \quad \lim_{x \rightarrow 1^+} f(x) = \ln(1) = 0$$

Since the one-sided limits are equal, $\lim_{x \rightarrow 1} f(x)$ exists.

$\lim_{x \rightarrow a} f(x) \text{ exists for all } a \neq 0$

Question 19

Numerical evaluation near $x = 3$

Let

$$f(x) = \frac{x^2 - 3x}{x^2 - 9}, \quad x \neq 3.$$

Evaluate the function at values close to 3, rounding to six decimal places.

$$f(3.1) = \frac{(3.1)^2 - 3(3.1)}{(3.1)^2 - 9} = \frac{9.61 - 9.3}{9.61 - 9} = \boxed{0.508197}$$

$$f(3.05) = \frac{(3.05)^2 - 3(3.05)}{(3.05)^2 - 9} = \frac{9.3025 - 9.15}{9.3025 - 9} = \boxed{0.504132}$$

$$f(3.01) = \frac{(3.01)^2 - 3(3.01)}{(3.01)^2 - 9} = \frac{9.0601 - 9.03}{9.0601 - 9} = \boxed{0.500832}$$

$$f(3.001) = \frac{(3.001)^2 - 3(3.001)}{(3.001)^2 - 9} = \frac{9.006001 - 9.003}{9.006001 - 9} = \boxed{0.500083}$$

$$f(3.0001) = \frac{(3.0001)^2 - 3(3.0001)}{(3.0001)^2 - 9} = \frac{9.00060001 - 9.0003}{9.00060001 - 9} = \boxed{0.500008}$$

$$f(2.9) = \frac{(2.9)^2 - 3(2.9)}{(2.9)^2 - 9} = \frac{8.41 - 8.7}{8.41 - 9} = \boxed{0.491525}$$

$$f(2.95) = \frac{(2.95)^2 - 3(2.95)}{(2.95)^2 - 9} = \frac{8.7025 - 8.85}{8.7025 - 9} = \boxed{0.495798}$$

$$f(2.99) = \frac{(2.99)^2 - 3(2.99)}{(2.99)^2 - 9} = \frac{8.9401 - 8.97}{8.9401 - 9} = \boxed{0.499165}$$

$$f(2.999) = \frac{(2.999)^2 - 3(2.999)}{(2.999)^2 - 9} = \frac{8.994001 - 8.997}{8.994001 - 9} = \boxed{0.499917}$$

From both the left and the right, the function values approach 0.5.

$$\boxed{\frac{1}{2}}$$

Question 32

$$\lim_{x \rightarrow 3^-} \frac{\sqrt{x}}{(x-3)^5}$$

- As $x \rightarrow 3^-$, $\sqrt{x} \rightarrow \sqrt{3}$ (finite and positive)
- $(x-3)^5 \rightarrow 0^-$ (odd power preserves sign)

Thus the quotient decreases without bound.

$$\boxed{-\infty}$$

Question 38

$$\lim_{x \rightarrow 3^-} \frac{x^2 + 4x}{x^2 - 2x - 3}$$

Factor:

$$\frac{x(x+4)}{(x-3)(x+1)}$$

Sign analysis as $x \rightarrow 3^-$:

- Numerator > 0
- Denominator < 0

Therefore the expression decreases without bound.

$$\boxed{-\infty}$$

Question 40

$$\lim_{x \rightarrow 0^+} \left(\frac{1}{x} - \ln x \right)$$

As $x \rightarrow 0^+$:

$$\frac{1}{x} \rightarrow +\infty, \quad \ln x \rightarrow -\infty$$

Thus

$$\frac{1}{x} - \ln x \rightarrow +\infty$$

Section 2.3

Question 6

Evaluate the limit:

$$\lim_{t \rightarrow 7} \frac{3t^2 + 1}{t^2 - 5t + 2}$$

By the **Quotient Law**, provided the denominator limit is nonzero,

$$\lim_{t \rightarrow 7} \frac{3t^2 + 1}{t^2 - 5t + 2} = \frac{\lim_{t \rightarrow 7} (3t^2 + 1)}{\lim_{t \rightarrow 7} (t^2 - 5t + 2)}$$

Numerator

Using the **Sum Law** and **Constant Multiple Law**,

$$\lim_{t \rightarrow 7} (3t^2 + 1) = \lim_{t \rightarrow 7} (3t^2) + \lim_{t \rightarrow 7} (1) = 3 \lim_{t \rightarrow 7} (t^2) + 1$$

Using the **Power of x Law** and **Constant Law**,

$$= 3(7^2) + 1 = 148$$

Denominator

Using the **Difference Law**, **Sum Law**, and **Constant Multiple Law**,

$$\lim_{t \rightarrow 7} (t^2 - 5t + 2) = \lim_{t \rightarrow 7} (t^2) - \lim_{t \rightarrow 7} (5t) + \lim_{t \rightarrow 7} (2)$$

Using the **Power of x Law**, **Identity Law**, and **Constant Law**,

$$= 7^2 - 5(7) + 2 = 16$$

Validity of the Quotient Law

Since

$$\lim_{t \rightarrow 7} (t^2 - 5t + 2) = 16 \neq 0,$$

the Quotient Law applies

Question 10

(a.) What is wrong with the equation

$$\frac{x^2 + x - 6}{x - 2} = x + 3?$$

Factor the numerator:

$$x^2 + x - 6 = (x + 3)(x - 2)$$

So for $x \neq 2$,

$$\frac{x^2 + x - 6}{x - 2} = \frac{(x + 3)(x - 2)}{x - 2} = x + 3$$

But at $x = 2$ the left-hand side is **undefined** (division by 0), while $x + 3$ **is** defined. So the equation is not true "for all x "; it is only true for $x \neq 2$.

The left side is undefined at $x = 2$, so it cannot equal $x + 3$ there.

(b.) Explain why

$$\lim_{x \rightarrow 2} \frac{x^2 + x - 6}{x - 2} = \lim_{x \rightarrow 2} (x + 3)$$

is correct.

Because the two functions are equal for all x sufficiently close to 2 (except at $x = 2$ itself):

$$\frac{x^2 + x - 6}{x - 2} = x + 3 \quad \text{for } x \neq 2$$

Limits only depend on values near the point, not at the point, so the limits agree.

$$\lim_{x \rightarrow 2} \frac{x^2 + x - 6}{x - 2} = \lim_{x \rightarrow 2} (x + 3) = 5$$

Question 16

Evaluate (if it exists):

$$\lim_{x \rightarrow 4} \frac{x^2 + 3x}{x^2 - x - 12}$$

Factor

$$\frac{x^2 + 3x}{x^2 - x - 12} = \frac{x(x + 3)}{(x - 4)(x + 3)}$$

Cancel the common factor $(x + 3)$ (valid when $x \neq -3$)

$$\frac{x(x + 3)}{(x - 4)(x + 3)} = \frac{x}{x - 4} \quad (x \neq -3)$$

Now check one-sided behavior as $x \rightarrow 4$

(a.) Left-hand limit

$$\lim_{x \rightarrow 4^-} \frac{x^2 + 3x}{x^2 - x - 12} = \lim_{x \rightarrow 4^-} \frac{x}{x - 4}$$

As $x \rightarrow 4^-$, we have $x \approx 4 > 0$ and $x - 4 < 0$, so $\frac{x}{x - 4} \rightarrow -\infty$

$$\lim_{x \rightarrow 4^-} \frac{x^2 + 3x}{x^2 - x - 12} = -\infty$$

(b.) Right-hand limit

$$\lim_{x \rightarrow 4^+} \frac{x^2 + 3x}{x^2 - x - 12} = \lim_{x \rightarrow 4^+} \frac{x}{x - 4}$$

As $x \rightarrow 4^+$, we have $x \approx 4 > 0$ and $x - 4 > 0$, so $\frac{x}{x - 4} \rightarrow +\infty$

$$\lim_{x \rightarrow 4^+} \frac{x^2 + 3x}{x^2 - x - 12} = +\infty$$

Since the one-sided limits are not equal, the two-sided limit does not exist

$$\boxed{\lim_{x \rightarrow 4} \frac{x^2 + 3x}{x^2 - x - 12} \text{ DNE}}$$

Question 18

Evaluate (if it exists):

$$\lim_{x \rightarrow -5} \frac{2x^2 + 9x - 5}{x^2 - 25}$$

Factor

$$2x^2 + 9x - 5 = (2x - 1)(x + 5), \quad x^2 - 25 = (x - 5)(x + 5)$$

Cancel $(x + 5)$ (valid when $x \neq -5$)

$$\frac{2x^2 + 9x - 5}{x^2 - 25} = \frac{(2x - 1)(x + 5)}{(x - 5)(x + 5)} = \frac{2x - 1}{x - 5}$$

Now substitute $x = -5$

$$\lim_{x \rightarrow -5} \frac{2x - 1}{x - 5} = \frac{2(-5) - 1}{-5 - 5} = \frac{-11}{-10} = \frac{11}{10}$$

Therefore the limit exists

$$\boxed{\frac{11}{10}}$$

Question 19

Evaluate (if it exists):

$$\lim_{t \rightarrow 3} \frac{t^3 - 27}{t^2 - 9}$$

Factor

$$t^3 - 27 = (t - 3)(t^2 + 3t + 9), \quad t^2 - 9 = (t - 3)(t + 3)$$

Cancel $(t - 3)$ (valid when $t \neq 3$)

$$\frac{t^3 - 27}{t^2 - 9} = \frac{(t - 3)(t^2 + 3t + 9)}{(t - 3)(t + 3)} = \frac{t^2 + 3t + 9}{t + 3}$$

Now substitute $t = 3$

$$\lim_{t \rightarrow 3} \frac{t^2 + 3t + 9}{t + 3} = \frac{9 + 9 + 9}{6} = \frac{27}{6} = \frac{9}{2}$$

Therefore the limit exists

$$\boxed{\frac{9}{2}}$$

Question 26

Evaluate (if it exists):

$$\lim_{h \rightarrow 0} \frac{\frac{1}{-2 + h} - \frac{1}{-2}}{h}$$

Rewrite the numerator

$$\frac{1}{-2+h} - \frac{1}{-2} = \frac{1}{-2+h} + \frac{1}{2}$$

Combine the fractions

$$\frac{1}{-2+h} + \frac{1}{2} = \frac{2+(-2+h)}{2(-2+h)} = \frac{h}{2(-2+h)}$$

Divide by h

$$\frac{\frac{h}{2(-2+h)}}{h} = \frac{1}{2(-2+h)}$$

Take the limit by direct substitution

$$\lim_{h \rightarrow 0} \frac{1}{2(-2+h)} = \frac{1}{2(-2)} = -\frac{1}{4}$$

Therefore the limit exists

$$\boxed{-\frac{1}{4}}$$

Question 30

Evaluate (if it exists):

$$\lim_{x \rightarrow 2} \frac{x^2 - 4x + 4}{x^4 - 3x^2 - 4}$$

Factor the numerator

$$x^2 - 4x + 4 = (x - 2)^2$$

Factor the denominator

$$x^4 - 3x^2 - 4 = (x^2 - 4)(x^2 + 1) = (x - 2)(x + 2)(x^2 + 1)$$

Cancel one factor of $(x - 2)$ (valid when $x \neq 2$)

$$\frac{(x - 2)^2}{(x - 2)(x + 2)(x^2 + 1)} = \frac{x - 2}{(x + 2)(x^2 + 1)}$$

Take the limit by direct substitution

$$\lim_{x \rightarrow 2} \frac{x - 2}{(x + 2)(x^2 + 1)} = \frac{2 - 2}{(2 + 2)(2^2 + 1)} = \frac{0}{(4)(5)} = 0$$

Therefore the limit exists

Question 38

Evaluate:

$$\lim_{x \rightarrow 0} \sqrt{x^3 + x^2 \sin\left(\frac{\pi}{x}\right)}$$

For all $x \neq 0$, we know

$$-1 \leq \sin\left(\frac{\pi}{x}\right) \leq 1 \quad \Rightarrow \quad x^2 \sin\left(\frac{\pi}{x}\right) \leq x^2 \quad (\text{since } x^2 \geq 0)$$

So

$$x^3 + x^2 \sin\left(\frac{\pi}{x}\right) \leq x^3 + x^2 = x^2(x + 1)$$

Whenever the square-root expression is defined (i.e., the inside is ≥ 0), we have:

$$0 \leq \sqrt{x^3 + x^2 \sin\left(\frac{\pi}{x}\right)} \leq \sqrt{x^2(x + 1)} = |x|\sqrt{x + 1}$$

As $x \rightarrow 0$, $|x|\sqrt{x + 1} \rightarrow 0$. By the Squeeze Theorem,

$$\lim_{x \rightarrow 0} \sqrt{x^3 + x^2 \sin\left(\frac{\pi}{x}\right)} = 0$$

Section 2.4

Question 2

We want a number $\delta > 0$ such that if $0 < |x - 3| < \delta$, then $|f(x) - 2| < 0.5$

The condition $|f(x) - 2| < 0.5$ means

$$1.5 < f(x) < 2.5$$

From the graph, the horizontal lines $y = 1.5$ and $y = 2.5$ intersect the curve at approximately

$$x = 2.6 \quad \text{and} \quad x = 3.8$$

So we need $(3 - \delta, 3 + \delta) \subset (2.6, 3.8)$

The largest allowable δ is the smaller distance to the endpoints

$$\delta = \min\{3 - 2.6, 3.8 - 3\} = \min\{0.4, 0.8\} = 0.4$$

$$\delta = 0.4$$

Question 14

Given that

$$\lim_{x \rightarrow 2} (5x - 7) = 3$$

find values of δ corresponding to $\varepsilon = 0.1, 0.05, 0.01$

Start from the ε -condition

$$|(5x - 7) - 3| < \varepsilon$$

Simplify

$$|(5x - 7) - 3| = |5x - 10| = 5|x - 2|$$

So it is enough to require

$$5|x - 2| < \varepsilon \implies |x - 2| < \frac{\varepsilon}{5}$$

$$\delta = \frac{\varepsilon}{5}$$

Now plug in the requested ε values

- If $\varepsilon = 0.1$, then $\delta = \frac{0.1}{5} = 0.02$, so

$$\delta = 0.02$$

- If $\varepsilon = 0.05$, then $\delta = \frac{0.05}{5} = 0.01$, so

$$\delta = 0.01$$

- If $\varepsilon = 0.01$, then $\delta = \frac{0.01}{5} = 0.002$, so

$$\delta = 0.002$$

Question 16

Prove using the ε - δ definition that

$$\lim_{x \rightarrow 2} (2 - 3x) = -4$$

Let $\varepsilon > 0$ be given

We want $\delta > 0$ such that if $0 < |x - 2| < \delta$, then

$$|(2 - 3x) - (-4)| < \varepsilon$$

Simplify the left-hand side

$$|(2 - 3x) + 4| = |6 - 3x| = |-3(x - 2)| = 3|x - 2|$$

So it is enough to require

$$3|x - 2| < \varepsilon \implies |x - 2| < \frac{\varepsilon}{3}$$

$$\boxed{\delta = \frac{\varepsilon}{3}}$$

Then $0 < |x - 2| < \delta$ implies $|(2 - 3x) - (-4)| = 3|x - 2| < 3\delta = \varepsilon$, as required

Question 17

Prove using the ε - δ definition that

$$\lim_{x \rightarrow -2} (-2x + 1) = 5$$

Let $\varepsilon > 0$ be given

We want $\delta > 0$ such that if $0 < |x - (-2)| = |x + 2| < \delta$, then

$$|(-2x + 1) - 5| < \varepsilon$$

Simplify

$$|(-2x + 1) - 5| = |-2x - 4| = |-2(x + 2)| = 2|x + 2|$$

So it is enough to require

$$2|x + 2| < \varepsilon \implies |x + 2| < \frac{\varepsilon}{2}$$

$$\boxed{\delta = \frac{\varepsilon}{2}}$$

Then $0 < |x + 2| < \delta$ implies $|(-2x + 1) - 5| = 2|x + 2| < 2\delta = \varepsilon$, as required

Section 2.5

Question 7

Sketch the graph of a function f that is defined on $\mathbb{R}$ and continuous except for:

- a **removable discontinuity** at $x = -2$
- an **infinite discontinuity** at $x = 2$

Removable discontinuity at $x = -2$, infinite discontinuity at $x = 2$

Question 20

The function is defined by

$$f(x) = \begin{cases} \frac{1}{x+2}, & x \neq -2, \\ 1, & x = -2 \end{cases}$$

with $a = -2$

Evaluate continuity at $x = -2$

Two-sided limit

$$\lim_{x \rightarrow -2} f(x) = \lim_{x \rightarrow -2} \frac{1}{x + 2}$$

As $x \rightarrow -2^-$, we have $x + 2 < 0$, so

$$\lim_{x \rightarrow -2^-} \frac{1}{x + 2} = -\infty$$

As $x \rightarrow -2^+$, we have $x + 2 > 0$, so

$$\lim_{x \rightarrow -2^+} \frac{1}{x + 2} = +\infty$$

Since the one-sided limits are not equal, the two-sided limit does not exist

Because the limit does not exist, it cannot equal $f(-2) = 1$

Therefore the function is discontinuous at $x = -2$

Discontinuous at $x = -2$

$$f(x) = \frac{1}{x + 2} \text{ for } x \neq -2, \quad f(-2) = 1$$

Question 24

The function is defined by

$$f(x) = \begin{cases} \frac{2x^2 - 5x - 3}{x - 3}, & x \neq 3, \\ 6, & x = 3, \end{cases}$$

with $a = 3$

Factor the numerator:

$$2x^2 - 5x - 3 = (2x + 1)(x - 3)$$

For $x \neq 3$

$$f(x) = 2x + 1$$

Two-sided limit

$$\lim_{x \rightarrow 3} f(x) = \lim_{x \rightarrow 3} (2x + 1) = 7$$

But

$$f(3) = 6$$

Since

$$\lim_{x \rightarrow 3} f(x) \neq f(3)$$

the function is discontinuous at $x = 3$

Removable discontinuity at $x = 3$

$$f(x) = \begin{cases} \frac{2x^2 - 5x - 3}{x - 3}, & x \neq 3 \\ 6, & x = 3 \end{cases}$$

The function is defined by

$$f(x) = \begin{cases} x + 2, & x < 0, \\ e^x, & 0 \leq x \leq 1, \\ 2 - x, & x > 1 \end{cases}$$

Check continuity at the junction points

At $x = 0$

Left-hand limit

$$\lim_{x \rightarrow 0^-} f(x) = \lim_{x \rightarrow 0^-} (x + 2) = 2$$

Right-hand limit

$$\lim_{x \rightarrow 0^+} f(x) = \lim_{x \rightarrow 0^+} e^x = e^0 = 1$$

Since

$$\lim_{x \rightarrow 0^-} f(x) \neq \lim_{x \rightarrow 0^+} f(x)$$

the two-sided limit $\lim_{x \rightarrow 0} f(x)$ does not exist

Also

$$f(0) = e^0 = 1$$

Discontinuous at $x = 0$

At $x = 1$

Left-hand limit

$$\lim_{x \rightarrow 1^-} f(x) = \lim_{x \rightarrow 1^-} e^x = e$$

Right-hand limit

$$\lim_{x \rightarrow 1^+} f(x) = \lim_{x \rightarrow 1^+} (2 - x) = 1$$

Since

$$\lim_{x \rightarrow 1^-} f(x) \neq \lim_{x \rightarrow 1^+} f(x)$$

the two-sided limit $\lim_{x \rightarrow 1} f(x)$ does not exist

Also

$$f(1) = e^1 = e$$

Discontinuous at $x = 1$

$$f(x) = \begin{cases} x + 2, & x < 0, \\ e^x, & 0 \leq x \leq 1, \\ 2 - x, & x > 1 \end{cases}$$
